PIR_79:* 1: pir1:* 2: pir2:* 3: pir3:* 4: pir4:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Bur. J. Biochem. 182:569-576(1989).
-!- FUNCTION: Involved in nuclear basic protein transition: histones
are replaced by spermatid specific proteins which are themselves
replaced by protemines in late spermatids.
-!- SUBCELLULAR LOCATION: Nuclear.

Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.

Claim 10; Page 14; 72pp; English.

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides

```
treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases but diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myacedema, myasthemia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-make for graft-versus-host disease, and delayed-type hypersensitivity. The goopsties of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which markes them ideal for use as molecular weight markers
                                                                                                                                                                                                                                                                                                                                                                                                                                            ô

of the invention are used as molecular weight markers for glatization catetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include arthritic conditions, demyelinating diseases. Such diseases include arthritic conditions, demyelinating diseases. Such diseases include arthritic conditions, demyelinating cliseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, autoimmune basmolylic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune uveoretinitis, contact disease, chronic immune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, diabetes disease, diabetes defined molecular weights and physical prophypeptides of the invention have defined molecular weight markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and amino acid composition corresponding to the copolymer. The polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Copolymer; molecular weight marker; TV-marker; immune disease; glatiramer acetate; autoimmune disease; antiarthritic; neuroprotective; osteopathic; immunosuppressive; antithyroid; antiinflammatory; antidiabetic; thyromimetic; hemostetic; antipsoriatic; dermatological; antidiabetic; immunosuppressive; demyelinating disease; osteoarthritis; inflammatory condition; multiple sclerosis; rheumatoid arthritis; crohn's disease; chronic immune thrombooytopaenia purpura; colitis; diabetes mellitus; Graves disease; Guillain-Barre's syndrome; psoriasis;
                                                                                                                                                                                                                                                                       Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Copolymer molecular weight TV-marker amino acid sequence SEQ ID NO:1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hashimoto's disease; idiopathic myxoedema; myasthenia gravis;
pemphigus vulgaris; systemic lupus erythematosus.

MAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acctate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune uveoretinitis, Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     disease, chronic immune thrombocytopaenia purpura, collitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxodema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated disease which can be treated include host-versus-graft disease, polypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ||:||:|||

                                                                                                                                                                                                                                                       The present sequence is that of a peptide of potential use for production of a coded probe useful in the method of the invention. The invention provides methods, apparatus and compositions for the detection, identification and/or sequencing of biomolecules, such as nucleic acids or proteins. Coded probes comprising a probe molecule attached to one or more nano-barcodes are allowed to bind to target molecule(s). After binding and separation from unbound coded probes, the bound coded probes are aligned on a surface and analysed by scanning probe microscopy (SPM). The methods allow the sequencing of long nucleic acid sequences in a single sequencing run, high speed of obtaining sequence data, low cost of sequencing and high efficiency in terms of operator time, and sensitive and accurate detection and/or identification of nucleic acids with low incidence of false positive results.
                                                                                                                                                    Detecting, identifying and sequencing of biomolecules using controlled alignment of nano-barcodes encoding specific information for scanning probe microscopy, useful in the fields of molecular biology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gene therapy; binding complex; lysis agent;

AAW24434-W24459 are nucleic acid (NA) binding peptides, capable of both condensing and stabilising a NA. The peptides can be conjugated to a lytic peptide to form a nucleic acid transporter system. The lysis agent forms an alpha-helical structure. The transporter system is used to deliver nucleic acid to a cell and for treating humans by gene therapy. By taking advantage of the characteristics of both the lysis agents and the binding molecules, delivery of the nucleic acid is enhanced. Specific lysis agents are capable of releasing the nucleic acid into the cellular interior from the endosome. Release is efficient without endosomallysosomal degradation. Once released the binding complexes help target the nucleic acid to the nucleus
                                                                                                                                                                                                                                                5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tumour neoangiogenesis; peptidase substrate; tumour related disorder; tumour-selective intravascular coagulation inducing molecule; blood clotting; tumour vascularisation; tumour growth control;

                                                                                                                                                                                                                                                                                                                                                           ä;
                                                                                                               The invention describes tumour-selective intravascular coagulation inducing molecules. The molecules are useful as a medicine and in the manufacture of a medicament for the treatment and/or prevention of tumour related disorders. The compounds are able to induce blood clotting at tumour sites resulting in the disruption of the tumour vascularisation and consequently in the control of tumour growth. This sequence represents a hepain-binding peptide, a postively charged polymer that can be incorporated into a substrate for extracellular hydrolases releasable by tumour or neoangiogenic endothelial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of a peptide of potential use for production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of a coded probe useful in the method of the invention. The invention provides methods, apparatus and compositions for the detection, identification and/or sequencing of biomolecules, such as nucleic acids or proteins. Coded probes comprising a probe molecule attached to one or more nano-barcodes are allowed to bind to target molecule(s). After binding and separation from unbound coded probes, the bound coded probes are aligned on a surface and analysed by scanning probe microscopy (SPM). An approach to coded probe synthesis entails creating polymer scaffolds to which nano-tag elements are attached through post-polymer assembly.
                                 tumor-selective intravascular coagulation inducing molecules useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting, identifying and sequencing of biomolecules using controlled alignment of nano-barcodes encoding specific information for scanning probe microscopy, useful in the fields of molecular biology.

For example, nano-tag elements can be attached to a peptide that has active groups (in the present case, lysine) at specific appropriately spaced sites. The peptide is then exposed to a mono-functionalised nanotag element and all of the active sites are modified. The methods allow high speed of obtaining sequence data, low cost of sequencing run, high speed of obtaining sequence data, low cost of sequencing and high efficiency in terms of operator time, and sensitive and accurate detection and/or identification of nucleic acids with low incidence of

```
This compound represents a glycopeptide effective in inhibiting the binding of labelled mannosylated BSA to mannose receptors. Mannose receptors are uniquely found on macrophages and not on monocytes. Glycopeptides are uniquely found on macrophages and not on monocytes specifically, to image, label, destroy or otherwise alter their antigen processing function. In addition they can be conjugated to solid supports and used to purify mannose receptors from a variety of sources. They are useful in the treatment of inflammatory diseases driven by macrophage secretory products eg. Crohn's disease; infectious diseases in which

disease; viral infections involving monouclear phagocytes eg. HIV and lysosomal storage diseases, in which macrophages are principally involved eg. Gaucher's disease; asthma mediated by alveolar macrophages; and in controlling metastasis, mediated by systemic macrophages. The peptides can also be used to deliver antigenic peptides as conjugates to a macrophage to marshal an immune response; also self peptides to prevent issue transplant rejection. The invention relates to a method for in vitro cell culture which involves adding a macroscopic membrane that is formed by self-assembly of amphiphilic peptide in an aqueous solution containing monovalent metal cations to a cell culture medium comprising cells, thus forming a membrane/culture mixture, maintaining the mixture under conditions sufficient for cell growth. The invention also relates to EAK16 peptide cellsicient for cell growth. The invention also relates to EAK16 peptide into the macroscopic membranes are useful in biomaterial applications such as medical products (e.g., sutures), artificial skin or internal into growth or culture and support for artificial tissue for in vitro cell crowth or culture and support for artificial tissue for in vivo use, as slow-diffusion drug delivery systems supports for in vivo use, as slow-diffusion drug delivery whicle for delivering protain-type drugs e.g., erythropoietin, synthetic haemoglobin, insulin, etc., useful as conductive biopolymer for culturing cell monolayers, for promoting cell adhesion and migration, useful as experimental models for Alzheimer's disease and scrapic infection. The present sequence is sea urchin histone invention.

The invention describes a method of culturing (M1) cells, in vitro. The cell culture involves adding a macroscopic membrane which is formed by self-assembly of amphiphilic peptides in an aqueous solution containing monovalent metal cations, where the peptides have alternating hydrophobic and hydrophilic amino acids and are complementary and structurally compatible, to a cell culture medium comprising cells, thus forming a membrane/culture mixture, and maintaining the mixture under conditions sufficient for cell growth. (M1) is useful for culturing a macroscopic membrane utilised in biomaterial applications e.g., slow-diffusion drug delivery systems, artificial skin or separation matrices, or as experimental models for Alzheimer's disease and scrapic infection e.g., liver cirrhosis, kidney amyloidosis, or other protein conformational claseases. (M1) enables in vitro culturing of macroscopic membrane that is stable in aqueous solution, serum and ethanol, highly resistant to heat, alkaline and acidic pH, chemical denaturants and proteolytic digestion, and is non-cytotoxic. This is the amino acid sequence of a region found in sea urchin histone HI delta which is homologous to yeast DNA binding protein zuotin from which amphiphilic peptides capable of forming membrane can be isolated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Culturing cells, in vitro, by adding macroscopic membrane formed by self-assembly of amphiphilic peptides and monovalent metal cations, to form culture mixture, and maintaining culture mixture under conditions for

```
nucleic acid molecule and a non-covalently associated set of nucleic acid condensing peptides (NACP), e.g. the present peptide, where each NACP is a heteropeptide, and the NACP set has low polydispersion. The SVLP, which is for transfecting a nucleic acid molecule into a mammalian cell, can be used for gene therapy. It is self assembling, and can be designed to target a particular cell or tissue type and deliver the nucleic acid molecule into its chromosomal or extrachromosomal sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2 KKYAKKEKAYAKAKAEAKAAKKAKAKAEAKKYAKAAKAEK-KEYAAAEAKYKAEAAKAAA 59

This sequence represents a nucleic acid condensing peptide that was identified using the method of the invention. The method is for screening contestions for the ability to optimally transfect cells with a nucleic acid molecule (NAM), and comprises: (a) detecting a change in the surface plasmon resonance (SPR) of a nucleic acid immobilised on a sensor chip and exposed to a solution of a test peptide, where the change in SPR occurs upon binding of the peptide to and dissociation of the peptide from the immobilised nucleic acid, to permit calculation of the cequilibrium constant (K(d)) (or apparent dissociation of the cequilibrium the peptide having K(d), with a value of Ix10-12 to Ix10-6 or kd, with a value of Ix10-6 to Ix10-11. The methods can be used for optimising the efficiency of transfecting cells with NAMs. They permit the selection of peptides having binding capacity for nucleic acid to provide a gene delivery complex that is stable in the bloodstream, targetable to selected tissue types, and capable of efficient transport into the cytoplasm and to the nucleus
                                                                                                                                                                                                                                                                                                                          Transfection of cells with nucleic acid(s) - comprises use of peptide(s) screened for interaction with nucleic acids on sensor chip by surface

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid condensing peptide; cell transfection; gene delivery system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence was used in the development of a novel method of vaccinating a mammal against a disease. The method comprises administering a nucleic acid encoding a 1st epitope and a peptide comprising a 2nd epitope, such that the nucleic acid and peptide are taken up by and expressed in a professional antigen presenting cell (APC) of the mammal, where an immune response is elicited in the mammal to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccination of mammals against disease - by introducing nucleic acid encoding a first epitope and a peptide comprising a second epitope into antigen presenting cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   epitope. The method can be used for immunisation against infectious against or disease targets, e.g. tumours. The method can be also be used to generate both prophylactic and therapeutic immune responses. The method provides for stimulation of class I and II MHC presentation by providing antigen to an APC in the form of an endogenously synthesised protein, i.e. a nucleic acid encoded epitope, and an exogenously synthesised synthesised protein. The method provides an enhanced and long lasting

This sequence represents a nucleic acid condensing peptide, that can be used to deliver the vector of the invention. The vector is a self-replicating, episomal DNA expression vector (A) for expressing a gene (I) comprises: (a) a self-replicating origin of replication (ori) and (b) a locus control region (LCR), or its component, that when linked to (I) alliects expression of (I) in a tissue-restricted manner. (A) and the vector pair are used for tissue-restricted expression of (I) in cultured cells; in vivo, particularly for gene therapy, e.g. of cancer, or exvivo, for subsequent return of transfected cells. Transgenic animals are used to test fidelity and efficacy of tissue-restricted expression before clinical trials, also for long-term production of (I)-encoded proteins. (A) provide stable gene expression over at least 10-15 cell generations
                                                                                                                                                                                                                 Self-replicating, episomal vector for tissue-restricted expression of genes - includes origin of replication and locus control region, optionally used with second vector expressing replication protein.
                                                                                                                                                                                                                                                                                                              Disclosure; Page 33; 66pp; English.

RESULT 2 S04941 protamine phi-3.1 - California mussel N.Alternate names: protamine PL-IV.1 C;Becies: Wytilus californianus (California mussel) C;Date: 07-Sep-1990 #sequence_revision 07-Sep-1990 #text_change 09-Jul-2004 C;Accession: S04941
R.Ausio, J.; McParland, R. Bur. J. Biochem. 182, 569-576, 1989 A.Title: Sequence and characterization of the sperm-specific protein phi3 from Mytilus of A.Reference numbers: 804941; MUID:89325302; PMID:2666130
A; Molecule type: protein A; Molecule type: protein A; Residues: 1-45 < AUS> A; Cross-references: UNIPROT: P11860 A; Note: 6-Thr, 17-Thr, and 18-Thr was also found C; Superfamily: histone H1
Civeywords: Day Dilighing; Indicates

a

à 셤 protamine phi-3.3 - California mussel
